GLOBAL / FUNCTIONAL MASTER CATALOG

Lulu Paid Advertising

Plan the campaign. Control the spend. Launch. Measure. Edit and improve.

An English global blueprint for paid-media planning, creative preparation, account management, campaign execution, measurement and bounded automatic optimization.

360 functions	60 modules	Complete paid lifecycle
Individually numbered requirements	Strategy, execution and operations	From advertiser onboarding to exit

Prepared for Lulu AI | Version 1.0 | 29 October 2026

Google, Meta, LinkedIn, TikTok, Microsoft, Pinterest, Snapchat and retail-media workflows, plus explicitly verified extensions for other networks. Includes paid search, social, product advertising, local leads, tracking, budgets and operational recovery.

Proposed requirements, not implemented software, verified account entitlements or certified compliance. Global design requires reviewed local readiness. Campaign support depends on actual APIs, versions, products and access. Targets, forecasts and automated controls do not guarantee results or exact final spend.

01 / PRODUCT CHARTER

Purpose, included operations and customer journey

The advertiser defines the business goal, real offer, intended markets and spending authority. Lulu prepares a reviewable plan and creative, verifies prerequisites, builds the supported campaign configuration, activates only authorized delivery, measures actual evidence and proposes or executes bounded changes.

Planning and economics

Research, acquisition strategy, media allocation, relevant goals, realistic scenarios, keyword and audience planning, costs and business-capacity constraints.

Creative and destinations

Evidence-based ad copy, paid-use image and media assets, creator authorization, product catalogs, destination quality and actual conversion journeys.

Execution and editing

Provider-specific campaign structures, budgets, bidding, targeting, schedules, exact release approvals, live edits, replacements, pauses and exception handling.

Measurement and learning

Browser and server signals, CRM outcomes, consent, deduplication, refunds, attribution limits, mature reporting, experiments and verified business feedback.

Operations and control

Authorized spending envelopes, pacing, provider access, API versions, policy review, account restrictions, incident response, agency isolation, billing evidence and customer exit.

Boundary: this bundle manages paid advertising. Content production, website delivery, CRM, finance and commerce are connected through explicit handovers. Ad-account access does not itself authorize unrestricted website editing, customer-data disclosure, payments or creation of new client accounts.

02 / ACTION CONTRACT

Authority, spending decisions and actual outcomes

Tag	Main gate	Required operating behavior
A	Automatic under approved policy	Use validated evidence, current permissions and bounded action or spending limits; retain the actual outcome and unresolved uncertainty.
U	Authorized decision or action	An accountable person plans, reviews, approves or performs the step. Analysis, creative approval and financial commitment are distinct authorities.
F	Qualified specialist or local review	Consequential claims, privacy, restricted sectors, rights and accounting questions require appropriate qualified owners where applicable.
X	Verified external capability	Confirm actual platform, account, campaign type, version and operation. A public feature description or connected account is insufficient.

Several gates may apply at once

Launching an ad can require account eligibility, qualified claim review, asset rights, concrete creative approval and a separate spending envelope. The tag marks the main gate; it does not remove other dependencies.

Four practical autonomy modes

Analysis-only; recommendations; execution after approval; and bounded automatic operation. Specify accounts, actions, evidence freshness, allowed increase or reduction ranges, cumulative limits and expiry. Larger or materially different commitments return to review.

Separate states

Planned, approved, submitted, accepted, under review, eligible, enabled, delivering, paused and reconciled are different facts. A successful request does not prove delivery, an accepted pause does not prove instant cessation of spend, and a rollback cannot reverse impressions already served.

03 / SPENDING CONTROL

Budget semantics, exposure and financial truth

Layer	What the system must represent
Advertiser authority	The approved amount, period, currency, accounts, delegated actions and responsible payer. Permission changes require attributable decisions.
Provider configuration	Average-daily, lifetime, shared or other budget semantics and actually available platform controls. Do not relabel a daily average as a hard daily ceiling.
Observed exposure	Reported spend with age, reporting gaps, expected in-flight delivery and outstanding mutations. Use conservative approved intervention margins.
Intervention	Requested, accepted and verified remote changes. Monitoring cannot guarantee an exact final amount when delivery and reporting are delayed.
Financial reconciliation	Served costs, reported spend, billed amounts, taxes, fees, credits and late corrections. Final invoices belong in the finance reconciliation process.

Provider-specific limits matter

Google documents that most campaigns can have daily billed limits above the average-daily budget and separate monthly rules, with exceptions and effects from budget changes. Other providers use different budget modes. Implement the current rules of the actual campaign; do not apply one formula universally. [S02-S04]

Prevent cumulative and conflicting changes

Evaluate aggregate authority across shared budgets, parallel jobs, native rules and other tools. Several small increases can collectively exceed a delegated ceiling. Serialize conflicting changes and reconcile actual state before another mutation.

Illustration: a client-authorized monthly envelope and a provider average-daily setting are different records. A late dashboard update cannot prove the remaining exposure is zero. The release interface must state the actual safeguards and their verified limits.

04 / VERIFIED ADAPTERS

Channels and provider capability boundaries

Implementation decision guide, not proof of production access. Verify the actual version, account, objective, format, market and operation before enabling a connector. Additional networks require separate onboarding and acceptance evidence.

Channel	Intended functions	Required distinction
Google Search / Shopping	Supported campaign, keyword, product, asset and measurement workflows.	Actual campaign and budget combinations, merchant readiness and goal mapping.
Performance Max / Demand Gen	Eligible automated-inventory structures, assets, goals and reporting.	Audience signals, expansion and available exclusions are not universal strict controls.
YouTube / video / display	Supported reports, media and permitted campaign-management routes.	Google video write support varies by type and version; native UI capability is not blanket API support.
Local Services Ads	Eligibility, verified supported settings, budgets, leads and feedback.	Standalone and newer variants differ; creation, countries and sub-entity support need specific review.
Meta	Approved campaign, ad-set, creative, ad and supported measurement operations.	Business identity, permissions, format, policy and actual mutation limits.
LinkedIn / TikTok	Verified paid-campaign formats, professional or creator context and reporting.	Organic permissions and public posts do not establish advertising or creator-promotion authority.
Microsoft	Supported campaign management, search or product controls and outcomes.	Imports require review of provider-specific semantics and unsupported settings.
Pinterest / Snapchat	Account-specific paid structures, media, audience and measurement operations.	Separate onboarding, budget modes, available formats and permissions.
Amazon / retail media	Eligible advertising products, marketplace identifiers, targeting and reporting.	Selling access is not API approval; retail and DSP features require actual scope.
Other networks	Conditional X, Reddit, app-store, DSP or regional extensions.	No operational promise until commercial, technical and local readiness are verified.

Research anchors: S01, S09-S17. An unsupported action becomes an explicit manual task or blocked capability, not a fabricated successful API outcome.

05 / SYSTEM OF RECORD

Shared records, measurement and global readiness

Record	Required relationships
Advertiser and account	Tenant, legal business, owner, platform, currency, time zone, permissions and billing responsibility.
Plan and authority	Business goals, actual offer, allocation, period, spending envelope, approval and permitted automatic actions.
Campaign configuration	Provider object IDs, budgets, groups, targeting, creatives, destinations, goals and version history.
Execution evidence	Exact request, initiator, approver, rule or agent, timestamp, remote response and reconciled outcome.
Measurement facts	Business outcome, event or order identity, permitted data, provider acceptance, attribution and maturity.
Finance and incidents	Reported costs, billed evidence, credits, unresolved exposure, corrective actions and accountable owners.

Source truth and advertising claims differ

A platform-attributed conversion is not necessarily an additional unique sale. Maintain deduplicated business outcomes separately. Browser and server events require permitted processing, stable identity and duplicate controls. Modeled or lagging data retains its uncertainty.

Worldwide design

Configure languages, scripts, markets, currencies and civil time with explicit supported scope. Qualified owners review applicable products, audiences, rights, privacy and local requirements. A global selector or available currency does not establish actual advertising eligibility.

Connections to Lulu

Content supplies reviewed paid-use assets. Online Presence supplies real pages and shop facts. CRM and commerce supply authorized outcomes. Finance reconciles actual costs. Workforce and logistics provide capacity constraints. The Paid Ads bundle preserves these boundaries while coordinating approved work.

FUNCTION CATALOG / GLOBAL DESIGN

01. Advertisers, businesses and product scope

PA-01-01 Advertiser workspaces [U]
Create separate advertiser records for each legal business, brand and client with responsible owners, permitted products, markets and actual advertising destinations.

PA-01-02 Account inventory [A]
Maintain stable platform, manager and advertiser identifiers with ownership, currency, time zone and access state; distinguish client accounts from agency administration accounts.

PA-01-03 Business truth [U]
Record approved services, locations, product facts, availability and commercial terms with authoritative sources; ad generation must not invent evidence or customer results.

PA-01-04 Responsibility model [U]
Define advertiser, agency, platform and technology-provider responsibilities for content, targeting, spending, billing and data; connected access does not imply unlimited financial authority.

PA-01-05 Enabled scope [U]
Enable only reviewed channel, campaign, format and market combinations; unsupported operations remain visible rather than being represented as universal advertising coverage.

PA-01-06 Product boundaries [U]
Treat this as the paid-advertising bundle, connected to content, online presence, commerce and CRM; it does not automatically authorize organic publishing or financial transfers.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

02. Platform access, account linking and credentials

PA-02-01 **Connection flows** [X]
Use supported authorization flows and actual account roles for each platform; confirm the exact advertiser selected before permitting read or write operations.

PA-02-02 **Manager hierarchies** [X]
Discover permitted manager-to-client relationships and access paths; linking an account must not silently transfer ownership or grant access to unrelated advertisers.

PA-02-03 **Permission inventory** [A]
Record scopes, roles, app access, token validity and supported operations per account; detect changes before executing a scheduled mutation.

PA-02-04 **Access renewal** [U]
Handle expired tokens, revoked permissions and required owner reauthorization with clear instructions; do not switch identities or reuse another client's credentials.

PA-02-05 **Credential protection** [A]
Secure tokens, developer credentials and secrets with controlled storage, rotation and audit; never expose reusable credentials in reports, prompts or diagnostic exports.

PA-02-06 **Access verification** [X]
Test authorized read and relevant write capability with safe representative operations; successful login alone does not prove campaign-management or reporting entitlement.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

03. Provider capabilities and versioned adapters

PA-03-01 Capability matrix [U]
Document create, read, edit, pause, remove, report and conversion operations separately by platform, campaign type, API version and account eligibility.

PA-03-02 UI versus API [A]
Identify native-interface features unavailable through the actual API; offer explicit manual completion instead of claiming a generic integration covers every visible option.

PA-03-03 Format eligibility [X]
Verify supported objectives, placements, bidding, assets and targeting combinations for the selected account; individually available settings may still form an invalid combination.

PA-03-04 Version management [A]
Track supported API versions, deprecations and schema changes; block or migrate affected workflows before unsupported fields corrupt an approved configuration.

PA-03-05 Adapter tests [U]
Maintain representative tests for permissions, validation, partial failures and remote-state reconciliation; mocks and documentation are preparation rather than production verification.

PA-03-06 Capability freshness [X]
Recheck material platform changes and account restrictions before release; publish actual unsupported, untested or read-only operations with accountable owners.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S01, S09-S17. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

04. Advertiser readiness and onboarding

PA-04-01 Business verification [X]
Track actual advertiser verification, identity checks and required platform onboarding with genuine outcomes; a submitted application must not appear as approval.

PA-04-02 Billing readiness [U]
Confirm the intended billing account, payment method, currency and responsible payer before activation; payment authority and campaign-edit authority remain separate.

PA-04-03 Domain and business assets [X]
Verify required domains, profiles, pages, catalogs and linked assets through supported mechanisms; a supplied URL alone does not establish ownership.

PA-04-04 Market eligibility [F]
Review intended product, audience and country combinations against applicable platform and local requirements with qualified owners; unsupported combinations remain blocked.

PA-04-05 Measurement readiness [U]
Confirm approved conversion definitions, event sources, consent handling and actual test evidence before optimizing for reported outcomes or making performance claims.

PA-04-06 Onboarding acceptance [U]
Approve a concrete readiness record listing enabled accounts, supported operations, spending authority and open issues; incomplete prerequisites cannot become implicit permission to launch.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

05. Goals, economics and success definitions

PA-05-01 Business objectives [U]
Define the actual acquisition, revenue, lead-quality, retention or awareness goal with an accountable owner and an explicit observation period.

PA-05-02 Conversion definitions [U]
Distinguish purchases, qualified leads, bookings, calls, installs and secondary events; a button click must not silently become a completed customer outcome.

PA-05-03 Economic inputs [U]
Record approved prices, margins, fulfillment costs, refund rates and customer-value assumptions with sources; estimates remain distinct from verified accounting facts.

PA-05-04 Target metrics [U]
Set relevant CPA, ROAS, qualified-lead cost or reach targets as goals, not guarantees; document what is included in each calculation.

PA-05-05 Constraint register [U]
Capture capacity, available stock, geography, sales response and restricted products before planning; advertising demand must not be increased without considering actual service readiness.

PA-05-06 Goal revisions [U]
Version changes to targets and measurement definitions; retain historical comparison context rather than judging past decisions against a newly invented success criterion.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

06. Research, competitive context and strategy

PA-06-01 Approved research [U]
Use permitted public research, advertiser evidence and available platform insights with original references; do not obtain private competitor account data through unauthorized access.

PA-06-02 Audience hypotheses [A]
Propose audience needs, objections and purchase contexts grounded in actual business information; label assumptions and avoid inventing sensitive personal traits.

PA-06-03 Competitive observations [A]
Record observed offers, messaging and public ad examples with dates; distinguish visible creative from unknown competitor spending, conversions or profitability.

PA-06-04 Funnel strategy [U]
Plan appropriate acquisition and follow-up stages around the real customer journey with relevant creative and measurement responsibilities for each stage.

PA-06-05 Channel rationale [U]
Explain proposed platforms and campaign types using audience fit, readiness, cost uncertainty and actual capability; no channel is universally best for every advertiser.

PA-06-06 Strategic review [U]
Reassess the plan when evidence, product availability or business constraints change; preserve rejected alternatives and unresolved uncertainties in the decision record.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

07. Media planning and cross-channel allocation

PA-07-01 Media plans [U]
Create proposed channel, campaign, market and time allocations within an explicitly authorized envelope with assumptions and expected measurement limitations.

PA-07-02 Scenario comparison [A]
Compare conservative, baseline and exploratory plans using disclosed inputs; forecasts are estimates rather than promised clicks, leads, sales or return on spend.

PA-07-03 Allocation rules [U]
Define approved floors, ceilings and priorities per channel or objective; consider learning needs and business constraints before moving budget.

PA-07-04 Cross-channel deduplication [A]
Avoid counting one platform-reported conversion as separate business outcomes across several channels; preserve each source and attribution perspective for reconciliation.

PA-07-05 Reallocation proposals [A]
Suggest changes using sufficiently fresh and comparable evidence with rationale, limits and expected consequences; existing spending permission does not automatically authorize every new allocation.

PA-07-06 Plan acceptance [U]
Approve the concrete budget version, accounts, objectives, dates and delegated changes before activation; retain the exact plan used by automatic workflows.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

08. Spending authority, budgets and financial guardrails

PA-08-01 Authorization envelopes [U]
Set explicit spending authority by advertiser, account, campaign, currency and period; include who may launch, increase budgets or approve exceptional commitments.

PA-08-02 Budget semantics [A]
Represent average-daily, fixed-daily, lifetime, shared and campaign-total budgets using actual provider meanings; a daily average must not be labeled a universal hard daily cap.

PA-08-03 Platform controls [X]
Apply available platform-level spending controls and limits where supported; verify scope, exceptions and actual account behavior rather than assuming every provider has equivalent controls.

PA-08-04 Exposure estimates [A]
Estimate outstanding exposure from recent spend, reporting delay, active settings and in-flight changes; show uncertainty instead of claiming a perfectly current spend total.

PA-08-05 Pre-change checks [A]
Evaluate the aggregate effect of proposed changes, shared budgets and parallel jobs before execution; prevent two individually valid requests from exceeding delegated authority together.

PA-08-06 Limit limitations [U]
Explain the actual protection offered by platform controls and application monitoring; delayed reporting and pause propagation mean a dashboard threshold cannot guarantee exact final spend.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S02-S04. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

09. Pacing, burn rate and budget reconciliation

PA-09-01 Pacing schedules [A]
Compare actual observed spending with the approved period, remaining time and planned distribution; use the account's real reporting calendar and currency.

PA-09-02 Spend freshness [A]
Track source timestamps, missing intervals and ingestion delay; stale spending data triggers conservative review or suspension of automatic expansion.

PA-09-03 Guard bands [U]
Configure approved safety margins and intervention thresholds appropriate to observed latency and provider behavior; disclose residual exposure rather than hiding it.

PA-09-04 Automatic intervention [A]
Request approved reductions or pauses when guardrails trigger, then verify actual remote state; a submitted pause does not prove delivery or billing stopped instantly.

PA-09-05 Budget-change effects [A]
Recalculate exposure after budget edits, schedule changes and shared-budget reassignment; preserve the original and revised authority for later investigation.

PA-09-06 Period closure [U]
Reconcile reported delivery, served costs, billed costs, credits and late adjustments with actual evidence; final finance reconciliation is separate from live pacing estimates.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S03-S04. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

10. Bidding strategies and auction controls

PA-10-01 Strategy eligibility [X]
Verify supported bidding strategies for the campaign objective, inventory, conversion setup and account; unavailable combinations remain blocked rather than silently substituted.

PA-10-02 Bid configuration [U]
Set approved bid limits, CPA or ROAS targets and portfolio relationships with clear currency and value units; display provider-specific interpretations.

PA-10-03 Learning awareness [A]
Identify available learning or limited-delivery signals and record recent material changes; avoid unsupported claims about exactly when a bidding model will stabilize.

PA-10-04 Change cadence [U]
Apply approved cooldowns and change limits to reduce conflicting or excessive interventions; evaluate evidence before repeatedly modifying automated bidding targets.

PA-10-05 Strategy migration [U]
Assess conversion quality, budget, eligibility and historical context before changing strategy; preserve the previous configuration and define an appropriate recovery decision.

PA-10-06 Outcome evaluation [A]
Compare actual bidding outcomes with approved goals and uncertainty; platform recommendations or optimization scores are not proof of advertiser profit.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

11. Forecasts, estimates and planning uncertainty

PA-11-01 **Provider forecasts** [X]
Retrieve supported reach, auction, keyword or cost estimates with query parameters and generation date; unavailable forecasting must not become fabricated precise numbers.

PA-11-02 **Internal scenarios** [A]
Build clearly labeled estimates from observed history and approved assumptions; disclose sparse samples, seasonality and the limits of extrapolating beyond existing spend.

PA-11-03 **Sensitivity analysis** [A]
Show how different conversion rates, lead quality, margins and auction costs affect expected outcomes; preserve input ranges rather than presenting one certain result.

PA-11-04 **Capacity forecasts** [U]
Consider stock, delivery capacity and sales-team responsiveness when estimating useful demand; an advertising forecast cannot independently increase operational capacity.

PA-11-05 **Forecast comparison** [A]
Compare forecasts with actual outcomes and record systematic errors; do not retrospectively rewrite assumptions to make the original prediction appear accurate.

PA-11-06 **No-guarantee presentation** [U]
Label estimates, targets and actual evidence consistently across proposals and client reports; avoid guaranteed rankings, lead volumes, revenue or returns without actual contractual basis.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

12. Keywords, queries and search-intent controls

PA-12-01 **Keyword research** [X]
Use approved platform research and advertiser sources to propose relevant search themes with actual available volume and cost evidence.

PA-12-02 **Keyword structure** [U]
Organize approved terms by intent, product, service and landing page with current supported match behavior; prevent accidental expansion beyond the intended business scope.

PA-12-03 **Negative keywords** [U]
Maintain reviewed exclusions at supported account, campaign or group levels; detect conflicts that would suppress intended valuable traffic.

PA-12-04 **Query review** [A]
Analyze actual available search-term reports with privacy and sampling limits; distinguish unseen queries from evidence that no other searches occurred.

PA-12-05 **Expansion proposals** [A]
Suggest keyword additions or exclusions using business relevance and sufficiently mature outcome evidence; low-volume noise must not automatically dictate large changes.

PA-12-06 **Brand and competitor terms** [F]
Review trademark, comparative-claim and platform restrictions for the intended use; keyword availability does not establish unrestricted permission for corresponding ad copy.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

13. Audiences, first-party data and exclusions

PA-13-01 Audience definitions [U]
Define approved audience criteria, business purpose, destinations and owners; distinguish available targeting controls from model-generated customer assumptions. Preserve the approval and purpose for each audience version.

PA-13-02 Customer-list handling [F]
Validate appropriate permission, platform eligibility and data terms before using customer data; hashing alone does not make personal information anonymous or unrestricted.

PA-13-03 Audience upload [X]
Normalize and transfer permitted identifiers through supported interfaces with actual acceptance diagnostics; an uploaded list does not guarantee matching or reachable scale.

PA-13-04 Exclusion management [A]
Apply supported customer, employee, irrelevant or restricted audience exclusions where approved; verify propagation and make unavailable controls visible.

PA-13-05 Audience restrictions [F]
Apply relevant sensitive-category, age and local targeting rules; do not infer or create prohibited personal classifications to obtain apparent performance gains.

PA-13-06 Audience lifecycle [A]
Track expiry, source changes, withdrawal and actual available audience status; revoke affected new uses and route historical data handling through the approved process.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

14. Remarketing and dynamic audience lifecycle

PA-14-01 Remarketing scope [F]
Define permitted website, app, customer and engagement-based use with qualified review of consent, purpose and platform restrictions before activation.

PA-14-02 Membership rules [U]
Configure eligible events, lookback windows, exclusions and frequency considerations using actual provider controls; document unsupported precision or missing membership evidence.

PA-14-03 Dynamic product links [X]
Connect approved catalog identities and actual product events for supported dynamic formats; reject mismatched identifiers and stale or unavailable products.

PA-14-04 Suppression updates [A]
Refresh approved purchaser, converted-lead or withdrawn-user suppression where supported; a local flag does not prove every remote audience already changed.

PA-14-05 Overlap and fatigue [A]
Identify observable audience overlap and repetitive exposure with available data; avoid presenting partial metrics as a complete cross-platform view of individuals.

PA-14-06 Eligibility failures [U]
Handle too-small lists, policy restrictions and invalid sources with an explicit alternative decision; do not bypass restrictions by relabeling the same audience.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

15. Geography, placements, devices and delivery conditions

PA-15-01 Location configuration [U]
Set approved countries, regions, service areas and exclusions with actual provider location semantics; distinguish presence, interest and unavailable targeting distinctions.

PA-15-02 Language and device [U]
Configure supported language, device and operating-system controls with advertiser rationale; interface availability does not prove the audience's actual language or device identity.

PA-15-03 Placement management [X]
Apply supported inventory selections and exclusions with actual account capability; automatic placements may not offer every requested manual restriction.

PA-15-04 Brand suitability [F]
Define reviewed content, inventory and publisher restrictions for the advertiser; expose limits where the platform cannot guarantee complete avoidance.

PA-15-05 Delivery schedules [A]
Apply approved business-hour and time-zone settings with verified provider behavior; account for daylight-saving changes and differences between campaign and ad-group schedules.

PA-15-06 Serviceability checks [A]
Compare targeting and creative promises with actual locations, stock and service coverage; unsupported regions remain blocked even when the platform accepts their targeting.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

16. Creative briefs, offers and message strategy

PA-16-01 Campaign briefs [U]
Capture objective, audience, product truth, offer, destinations, required formats and acceptance criteria before producing chargeable campaign configurations. Identify unresolved prerequisites and the people responsible for resolving them.

PA-16-02 Offer validation [U]
Verify actual prices, dates, availability, eligibility and conditions using authoritative business sources; do not manufacture discounts or scarcity to improve response.

PA-16-03 Message frameworks [A]
Propose evidence-based angles, objections and benefits with brand guidance; separate creative hypotheses from verified claims and guaranteed outcomes.

PA-16-04 Format planning [X]
Determine supported text, image, video, carousel, catalog and lead formats for the intended campaign and placement before producing incompatible assets.

PA-16-05 Creative dependencies [A]
Link each ad version to source facts, rights, landing pages and required disclosures; expired or changed dependencies trigger applicable review before delivery.

PA-16-06 Brief approval [U]
Approve the exact permitted offer and creative direction with responsible owners; a strategy approval does not automatically authorize unlimited creative variants or spending.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

17. Ad copy, assets and factual claim review

PA-17-01 Copy generation [A]
Draft headlines, descriptions and calls to action using approved business facts, brand rules and destination-specific constraints; incomplete facts remain unresolved rather than invented.

PA-17-02 Combination checks [A]
Review possible responsive-asset combinations for misleading claims, missing qualifications and repetition; individually acceptable text fragments can still create a problematic combined message.

PA-17-03 Text validation [A]
Check actual character, encoding, capitalization and field requirements for the selected platform; retain validation errors rather than truncating essential conditions silently.

PA-17-04 Claim approval [F]
Route consequential comparisons, regulated claims, testimonials and numerical results to appropriately qualified review with actual supporting evidence and applicable context.

PA-17-05 Localized copy [U]
Adapt text for intended languages and markets with correct terms and reviewed offers; translated claims require the same factual and permission checks.

PA-17-06 Copy revisions [U]
Show precise before-and-after changes and bind approval to the selected version; live ad changes may trigger review, new objects or delivery consequences.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

18. Image production and paid-use asset preparation

PA-18-01 Image sourcing [U]
Use approved original, licensed or generated images with clear business purpose and references; record whether the asset is factual product photography or an illustration.

PA-18-02 Paid-use rights [F]
Verify that stock, fonts, templates, likenesses and commissioned assets permit the intended advertising use, territory, modification and duration.

PA-18-03 Brand and fidelity [U]
Review logos, colors, product variants, packaging and included accessories against approved references; visual appeal cannot override an inaccurate product representation.

PA-18-04 Image editing [X]
Produce supported crops, cutouts, retouching and layout variants with preserved originals; inspect unintended changes after generative editing or format conversion.

PA-18-05 Placement exports [A]
Generate supported sizes, aspect ratios, safe areas and readable overlays; preserve exact asset identities so the correct approved derivative is uploaded.

PA-18-06 Creative QA [U]
Inspect actual image text, critical prices, dates, visible defects and disclosure context together with the caption and landing page before approving advertising use.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

19. Video, audio, creators and authorized content reuse

PA-19-01 Video requirements [U]
Prepare briefs, scripts, storyboards and required output specifications for supported ad formats; full media production can be delivered through an explicitly approved specialist workflow.

PA-19-02 Video asset preparation [X]
Ingest or produce supported media through verified tools, checking duration, encoding, captions, audio rights and actual placement requirements before upload.

PA-19-03 Creator authorization [F]
Record actual creator permission, identity, licensed usage and expiry for partnership, sponsored or creator-authorized ads; organic-post access alone is insufficient.

PA-19-04 Existing-post promotion [X]
Use eligible existing posts only through supported authorization and identity controls; a public URL is not automatic permission to promote another person's content.

PA-19-05 Disclosure and authenticity [F]
Apply reviewed commercial, synthetic-content and sensitive-representation requirements for the actual market and platform; do not manufacture customer evidence or endorsements.

PA-19-06 Reuse limits [A]
Track where authorized media appears and which campaigns depend on it; expiring rights or revoked authorization create accountable stop or replacement work.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

20. Creative library, approvals and fatigue management

PA-20-01 Creative registry [A]
Maintain master assets, variants, rights, facts, reviewers and remote asset references with stable identities across accounts and campaign versions.

PA-20-02 Exact creative approval [A]
Bind approval to text, images, video, links, audience context and required disclosures; material changes invalidate the affected creative release permission.

PA-20-03 Asset processing [X]
Track actual uploaded, processing, accepted and rejected states with provider evidence; a completed transfer does not guarantee an eligible or deliverable ad.

PA-20-04 Fatigue analysis [A]
Identify available frequency, response and conversion trends with uncertainty and sample context; avoid declaring creative fatigue from one short noisy interval.

PA-20-05 Refresh proposals [U]
Propose new versions or rotation changes within approved rights and budgets; evaluate whether replacement affects identity, review or learning before execution.

PA-20-06 Content-bundle connection [U]
Exchange approved briefs and assets with the Content Creation bundle while retaining paid-use review; organic-content approval does not automatically authorize paid promotion.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

21. Landing pages, destination health and conversion readiness

PA-21-01 Destination validation [A]
Check the intended final URL, redirects, locale and relevant page availability before launch; valid syntax alone does not prove a working customer journey.

PA-21-02 Message alignment [U]
Review whether ad promises, product facts, price and conditions match the actual destination; misleading differences block activation or trigger correction.

PA-21-03 Journey testing [U]
Test representative forms, purchases, bookings or calls with attributable evidence; a visible button or successful page load is not a completed customer conversion.

PA-21-04 Page quality [A]
Check relevant speed, mobile usability and obvious access failures with evidence and limitations; automated scoring does not certify accessibility or universal device compatibility.

PA-21-05 Site release coordination [U]
Coordinate approved landing-page edits with the Online Presence bundle and actual site authority; changing an ad destination does not authorize unrelated site modifications.

PA-21-06 Health-triggered controls [A]
Apply approved pauses or reviews after verified broken pages, unavailable offers or unsafe redirects; distinguish detection, pause request and actual provider confirmation.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

22. Product feeds, merchant readiness and catalog ads

PA-22-01 Catalog mapping [U]
Map advertiser products, variants and destination URLs to supported platform catalog identifiers; preserve authoritative commerce references and actual assortment boundaries.

PA-22-02 Merchant prerequisites [X]
Verify real account, website, business and applicable merchant requirements with actual outcomes; submitted verification or feed files are not proof of advertising eligibility.

PA-22-03 Feed consistency [A]
Compare price, currency, stock, images and product facts with the live shop and approved records; stale feed data creates visible corrective work.

PA-22-04 Product eligibility [F]
Review restricted goods, required identifiers and local advertising rules for the intended catalog use; available checkout does not establish ad-policy eligibility.

PA-22-05 Feed diagnostics [X]
Collect actual rejected-item reasons and supported processing states; distinguish accepted data, eligible products and delivered ads in reporting.

PA-22-06 Stock and margin controls [A]
Use approved stock, margin and availability rules for product selection and pause proposals; do not independently change inventory or invent product profitability.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

23. Measurement architecture and conversion plans

PA-23-01 Measurement map [U]
Document each business outcome, source system, event, identifier, platform destination and accountable owner before instrumenting or importing conversion data.

PA-23-02 Goal configuration [U]
Separate primary bidding goals from secondary observations with approved count and value rules; prevent accidental optimization toward low-value micro-events.

PA-23-03 Value definitions [F]
Agree gross or net revenue, margin estimates, currency, refunds and recurring-value treatment with responsible business or finance owners before reporting return.

PA-23-04 Identifier strategy [U]
Define permitted click, order, lead and event identifiers with deduplication and retention rules; prevent confidential identifiers from leaking into public URLs.

PA-23-05 Test evidence [U]
Use representative events to verify actual collection, delivery and provider acceptance without inflating production outcomes; record test versus real event treatment.

PA-23-06 Measurement change control [A]
Version event and goal changes and identify reporting discontinuities; historical results cannot be treated as directly comparable after an unacknowledged definition change.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S05-S06, S19. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

24. Browser tags, consent-aware collection and diagnostics

PA-24-01 Tag inventory [A]
Maintain actual installed tags, pixels, triggers, owners and purposes across intended pages; a configured dashboard entry is not proof that the browser executes it.

PA-24-02 Installation workflow [U]
Prepare approved implementation or tag-manager changes with site-owner authority and rollback; do not publish unrelated website changes to install measurement.

PA-24-03 Consent-state behavior [F]
Implement reviewed collection behavior for relevant jurisdictions and choices; a consent interface or mode flag alone does not establish lawful tracking.

PA-24-04 Event validation [A]
Check actual event names, parameters, values and duplicate triggers in representative browsers; page refreshes and repeated clicks must not inflate confirmed purchases.

PA-24-05 Environment separation [A]
Keep test domains, internal traffic and development events distinguishable from live business outcomes using approved platform-supported controls. Confirm that test events cannot drive live bidding decisions.

PA-24-06 Failure diagnostics [U]
Investigate blocked scripts, browsers, extensions and consent restrictions with evidence; missing signals must not trigger unauthorized attempts to bypass user choices.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S07. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

25. Server-side events and conversion APIs

PA-25-01 Permitted event sources [F]
Approve actual server-side event purposes, data terms and allowed fields before transmission; moving collection off the browser does not remove privacy obligations.

PA-25-02 Event transport [X]
Send validated events to supported conversion interfaces with actual account mapping and credentials; network success is distinct from provider acceptance or attribution.

PA-25-03 Deduplication design [A]
Use appropriate stable event identifiers across browser and server paths where supported; prevent the same transaction from becoming two business conversions.

PA-25-04 Normalization and protection [A]
Apply required formatting, minimization and hashing where relevant while retaining permission evidence; hashing must not be described as automatic anonymization.

PA-25-05 Delivery diagnostics [A]
Track accepted, rejected, partial and delayed results with source references; retries preserve original identity and do not duplicate previously accepted events.

PA-25-06 Data-quality review [U]
Assess missing fields, match diagnostics and freshness without overstating identity certainty; stronger match signals do not establish true causal advertising impact.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S05-S07. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

26. Offline outcomes, CRM imports and conversion adjustments

PA-26-01 Lead-stage mapping [U]
Map genuine new leads, qualified leads, opportunities and won outcomes to approved conversion definitions; preserve actual CRM evidence and stage timestamps.

PA-26-02 Offline uploads [X]
Import eligible events using supported identifiers, windows and permission controls; missing click references or unsupported timestamps require honest rejection or review.

PA-26-03 Duplicate control [A]
Prevent repeated CRM exports and retry queues from uploading the same outcome multiple times; keep a traceable link to the original business record.

PA-26-04 Refund and retraction [X]
Submit supported value restatements or retractions from approved actual outcomes; a local refund record does not prove the platform's conversion report already changed.

PA-26-05 Late-event handling [A]
Track processing deadlines and attribution limitations for delayed sales; label unmatched or expired events instead of fabricating advertising credit.

PA-26-06 Outcome-quality feedback [U]
Use verified lead quality and realized value to inform approved optimization decisions; do not confuse submitted feedback with confirmed platform-model improvement.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S19. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

27. Privacy, consent and sensitive-data governance

PA-27-01 Purpose and data register [F]
Document personal-data sources, purposes, recipients and applicable permissions with qualified review for the actual advertiser, markets and targeting activities.

PA-27-02 User-choice propagation [A]
Apply approved withdrawal, restriction and deletion changes to relevant future processing and supported destinations; show unresolved downstream propagation honestly.

PA-27-03 Sensitive-data restrictions [F]
Prevent prohibited or inappropriate sensitive data, confidential CRM notes and unnecessary personal details from entering audiences, URLs, prompts or conversion payloads.

PA-27-04 Platform data terms [F]
Verify acceptance and applicability of required customer-data terms before uploading; connected credentials do not replace the advertiser's required contractual authority.

PA-27-05 Retention controls [F]
Apply reviewed storage schedules and legal holds to click identifiers, lead forms, audiences and diagnostic payloads with restricted access and accountable deletion.

PA-27-06 Privacy incident handling [U]
Contain unauthorized transmission, identify affected destinations and preserve evidence for responsible review; stop affected jobs without claiming remote erasure before confirmation.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S05, S07. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

28. Attribution, incrementality and cross-platform truth

PA-28-01 Attribution definitions [U]
Record platform models, click and view windows, reporting dates and available modeled components; metrics with different definitions must not be silently compared as equivalent.

PA-28-02 Cross-platform reconciliation [A]
Retain each platform's claimed conversions separately from deduplicated actual sales or qualified leads; the same business transaction may appear in several reports.

PA-28-03 Lag and maturity [A]
Show conversion delay, incomplete recent periods and later revisions; immature data must not automatically trigger major budget decisions as if it were final.

PA-28-04 Incrementality methods [U]
Plan supported holdouts, lift studies or geographic tests with appropriate design and eligibility; attributed conversions alone do not prove incremental outcomes.

PA-28-05 Modeling limits [U]
Explain modeled, sampled or privacy-limited data and missing visibility; avoid presenting modeled user journeys or cross-device estimates as observed individual facts.

PA-28-06 Business reporting [F]
Reconcile spend, actual revenue, refunds, contribution assumptions and uncertainty with responsible owners; platform ROAS is not automatically audited profit.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

29. Google Search campaigns and responsive assets

PA-29-01 Search capability [X]
Verify actual Google Ads access, intended customer account, campaign type and supported API operations before creating or changing Search configurations.

PA-29-02 Campaign structure [U]
Build approved campaigns and ad groups linked to relevant budgets, goals, landing pages and supported targeting; create inactive objects until authorized activation.

PA-29-03 Keyword controls [X]
Manage supported keywords, match settings and exclusions with actual validation; inspect conflicting negatives and unavailable criteria before release.

PA-29-04 Responsive assets [U]
Prepare approved headline and description combinations, pinning where supported and other eligible assets; validate how combinations could change the message.

PA-29-05 Query optimization [A]
Review available search terms, cost and mature outcome evidence to propose scoped changes; retain reporting limitations and business-relevance constraints.

PA-29-06 Search status reconciliation [A]
Track actual review, eligibility, configuration and available delivery evidence; an enabled campaign is not proof that impressions or qualified leads occurred.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S01. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

30. Google Shopping and merchant-linked advertising

PA-30-01 Merchant links [X]
Verify actual merchant-account links, product-source readiness and advertising permissions; a valid feed alone does not establish a functioning paid campaign.

PA-30-02 Shopping structure [U]
Configure supported product groups, campaign settings and approved exclusions using correct product identities; retain the precise selected assortment.

PA-30-03 Bid and budget setup [U]
Apply eligible strategy and budget combinations with authorized amounts and provider-specific behavior; do not silently switch to another campaign type on validation failure.

PA-30-04 Product diagnostics [A]
Connect feed rejection, policy and availability issues to affected advertising entities; distinguish data ingestion from ad approval and actual delivery.

PA-30-05 Commerce consistency [A]
Check actual live prices, stock, currency and destination behavior before activation or scheduled expansion; stale offers require appropriate intervention.

PA-30-06 Shopping measurement [A]
Report spend and available product outcomes with attribution, margin and refund limitations; product-level results remain separate from verified overall business profitability.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S01. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

31. Performance Max, Demand Gen and automated inventory

PA-31-01 Campaign eligibility [X]
Verify the supported campaign subtype, account permissions, markets and actual API version; do not generalize one automated campaign's capabilities to every related product.

PA-31-02 Asset-group configuration [U]
Build supported asset or ad groups with approved messages, images, video and destinations; validate required combinations and incomplete creative dependencies.

PA-31-03 Automation settings [U]
Review platform-managed expansion, generated assets and destination behavior where configurable; disclose controls unavailable for the selected campaign instead of implying precise manual targeting.

PA-31-04 Audience and product signals [X]
Apply supported audience, product and contextual inputs with accurate semantics; a signal is not necessarily a strict targeting restriction.

PA-31-05 Exclusions and safeguards [X]
Use verified brand, product, location or other exclusion controls where available; record missing controls and residual inventory uncertainty before activation.

PA-31-06 Reporting and edits [A]
Collect actual supported performance breakdowns and propose authorized changes; limited transparency must not become invented placement or user-level explanations.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S01. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

32. YouTube, video, display and advanced inventory

PA-32-01 Inventory assessment [U]
Document intended video, display, connected-TV or other inventory and its actual buying route; native availability does not establish complete API write capability.

PA-32-02 Video API boundaries [X]
Distinguish read-only, restricted and writable Google video-related operations by campaign type and version; use verified supported alternatives or explicit manual steps where necessary.

PA-32-03 Media and placement review [U]
Validate actual video, audio, companion images, captions and destination behavior against supported formats and approved rights before a campaign can spend.

PA-32-04 Display controls [X]
Apply supported contextual, publisher, placement and suitability settings with account-specific evidence; do not promise complete prevention of every unwanted impression.

PA-32-05 Programmatic extensions [U]
Add DSP, connected-TV, audio or direct publisher buying only through separately verified access, contracts, inventory and billing controls; a reporting integration alone cannot place media.

PA-32-06 Delivery evaluation [A]
Separate views, viewability, clicks, completion and attributed actions using actual definitions; exposure metrics do not independently prove attention, brand lift or sales impact.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S09. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

33. Local Services Ads and local lead programs

PA-33-01 Local eligibility [F]
Review actual service category, geography, business identity, licensing, insurance and other program prerequisites; a business profile is not sufficient proof of eligibility.

PA-33-02 Program readiness [X]
Track real application, verification and account states through supported interfaces or assigned manual tasks; application submission cannot be reported as approval.

PA-33-03 Campaign-type distinction [X]
Separate standalone Local Services campaigns from eligible newer variants with version and country restrictions; do not apply one variant's creation support universally.

PA-33-04 Supported management [X]
Verify actual read, status, budget, schedule, location and bid operations independently; unsupported creation or sub-entity changes remain explicit limitations.

PA-33-05 Lead evidence [X]
Retrieve permitted lead details and supported feedback outcomes with privacy controls; a charged contact, qualified lead and won customer remain different facts.

PA-33-06 Local outcome review [U]
Review genuine lead quality, response capability and available dispute or feedback paths; no automatic guarantee of refunds, lead volume or business verification is implied.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S10. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

34. Meta advertising across Facebook and Instagram

PA-34-01 Business asset authority [X]
Verify the actual business, ad account, Page, Instagram identity and required permissions; access to an organic account is not automatic advertising authority.

PA-34-02 Campaign hierarchy [U]
Create approved campaigns, ad sets, creatives and ads with supported objectives and correct parent identities; preserve inactive state until release is authorized.

PA-34-03 Audience and delivery [X]
Configure supported targeting, placements and automatic-expansion settings with actual account constraints; disclose where platform optimization broadens or limits intended controls.

PA-34-04 Creative identities [U]
Review advertiser identity, selected existing posts, media and destination as a whole; preserve required creator permissions and paid-use rights.

PA-34-05 Measurement and leads [X]
Connect supported events, conversion interfaces and lead assets through verified permissions; retain actual diagnostics, event definitions and deduplication behavior.

PA-34-06 Meta change handling [A]
Track review, delivery and configurable status separately; creative replacements and material edits may create new objects or review consequences rather than an invisible in-place correction.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S11. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

35. LinkedIn advertising and professional audiences

PA-35-01 Advertising access [X]
Verify the advertiser account, organization identity, roles and actual Advertising API access; organic-post permission alone does not establish paid campaign capability.

PA-35-02 Campaign management [U]
Build supported campaign groups, campaigns and creatives using approved objectives, budgets, dates and commercial context before authorized activation.

PA-35-03 Professional targeting [F]
Use permitted professional criteria, exclusions and audience sources with qualified review of sensitive or restricted uses; interface availability does not eliminate legal obligations.

PA-35-04 Format validation [X]
Check actual advertising format, identity, destination and API support; sponsored carousel, organic document and multi-image products must not be treated as interchangeable.

PA-35-05 Lead-generation assets [X]
Use supported forms and lead retrieval with correct ownership, terms and downstream permissions; do not expose personal leads through ordinary aggregate reporting.

PA-35-06 Reporting and revisions [A]
Use supported versioned APIs for outcomes and authorized mutations with review of editable fields; report unavailable or restricted operations honestly.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S12. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

36. TikTok paid campaigns and creator-authorized ads

PA-36-01 Marketing access [X]
Verify actual TikTok advertiser, business permissions and Marketing API operations; organic Content Posting authorization does not establish paid-advertising access.

PA-36-02 Campaign objects [U]
Configure supported campaigns, ad groups and ads with approved objectives, budgets, targeting and destinations; retain exact request and parent relationships.

PA-36-03 Creative requirements [U]
Prepare permitted media, captions, music and identity context for actual ad formats; do not assume an organic media license includes paid distribution.

PA-36-04 Creator authorization [X]
Validate required permission and eligible source objects for creator-linked or Spark-style promotion; expired authorization blocks affected future releases or creates intervention work.

PA-36-05 Events and optimization [X]
Configure supported conversion signals and lead or commerce objectives with valid data terms, account mappings and actual acceptance evidence.

PA-36-06 Edit and review states [A]
Track supported mutations, review, delivery and budget outcomes separately; a saved change does not prove the ad immediately resumed delivery or retained its prior learning state.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S13. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

37. Microsoft Advertising and related campaign formats

PA-37-01 Account prerequisites [X]
Verify actual developer access, advertiser identity, account permissions and applicable market support before enabling read or mutation operations.

PA-37-02 Campaign structure [U]
Build supported Search, Shopping or other available campaign structures with approved goals, budgets, product links and actual format-specific requirements.

PA-37-03 Keyword and audience controls [X]
Apply supported keyword, negative, location, audience and placement operations using verified behavior; similar Google settings do not establish exact Microsoft equivalence.

PA-37-04 Import review [U]
Review imported configurations and provider defaults before activation; unsupported settings and differing semantics must remain visible rather than silently converted.

PA-37-05 Conversion signals [X]
Integrate actual supported measurement and offline-outcome interfaces with consent and duplicate controls; imported events need genuine processing evidence.

PA-37-06 Status and reports [A]
Collect supported editorial, campaign and performance data with actual definitions; authorized edits and pauses require remote-state reconciliation rather than assumed success.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S14. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

38. Pinterest and Snapchat paid-channel adapters

PA-38-01 Separate provider models [U]
Maintain distinct account, campaign, ad-group or ad-squad and creative mappings; a shared dashboard must not hide incompatible provider settings.

PA-38-02 Pinterest activation [X]
Verify business access, billing, intended market and supported campaign and ad operations; some onboarding or premium placements may need native or provider-assisted workflows.

PA-38-03 Snap activation [X]
Verify actual organization, funding source, account, credentials and supported Ads API operations before approving campaign creation or changes.

PA-38-04 Format preparation [U]
Produce compatible approved creative, catalog and destination assets with appropriate rights; unsupported placements require an explicit decision rather than a forced generic format.

PA-38-05 Budget and schedule semantics [A]
Preserve each provider's actual budget modes, inheritance and schedule precedence; a common field label cannot replace the underlying platform-specific validation.

PA-38-06 Measurement and mutation [X]
Verify reporting, conversion-event and edit capability separately; do not infer public-profile or organic-content access from paid-advertising account permissions.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S15-S16. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

39. Amazon Ads, retail media and marketplace advertising

PA-39-01 Retail-media access [X]
Verify actual advertiser eligibility, region, seller or vendor context and API approval; a marketplace selling account does not automatically grant advertising integration access.

PA-39-02 Product and offer readiness [A]
Use genuine marketplace product identities, offer availability and relevant commerce constraints; an advertised item may become ineligible without the local catalog changing.

PA-39-03 Campaign configuration [U]
Create approved supported sponsored or other eligible campaign types using actual targeting, bidding and budget requirements; premium or DSP capabilities need separate verified scope.

PA-39-04 Keyword and product targets [X]
Manage permitted keyword, product and category targeting with relevant exclusions and actual diagnostics; keep each marketplace's semantics and identifiers distinct.

PA-39-05 Retail outcome measures [A]
Report source-defined sales, spend and available metrics with attribution and return limitations; platform-reported advertising cost ratios do not establish net business profit.

PA-39-06 Retail operations feedback [U]
Review inventory, pricing, offer suppression and margin changes before automatic expansion; do not independently alter marketplace prices or stock to improve campaign metrics.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S17. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

40. X, Reddit, app-store and regional ad networks

PA-40-01 Extension registry [U]
Register additional channels individually with intended markets, campaign products, permissions and responsible owners; no universal all-network creation or editing claim is implied.

PA-40-02 Access qualification [X]
Verify actual commercial and API access for X, Reddit, app-store search or regional networks before exposing them as operational destinations.

PA-40-03 App acquisition requirements [F]
Review actual app identity, store eligibility, measurement permissions and applicable privacy requirements before using install or in-app optimization workflows.

PA-40-04 Local ecosystem review [F]
Assess language, regulated-product rules, advertiser registration and partner requirements for regional networks; international account access does not establish local operating readiness.

PA-40-05 Adapter acceptance [U]
Require representative creation, pause, edit, reporting and failure-path tests for each enabled product; untested premium or reserved inventory remains unavailable.

PA-40-06 Honest fallback [U]
Provide approved media plans, asset packs and accountable manual tasks when API support is unavailable; report actual completion rather than marking exported instructions as a live campaign.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

41. Campaign construction and dependency orchestration

PA-41-01 Draft specifications [A]
Represent the approved plan as typed campaign, budget, targeting, creative, destination and measurement records with provider-specific validation and stable identifiers.

PA-41-02 Dependency planning [A]
Sequence accounts, budgets, assets, audiences and campaigns so child objects reference actual accepted parents; missing dependencies block affected operations.

PA-41-03 Safe creation [A]
Create paused, draft or otherwise non-spending objects where supported until release conditions pass; unavoidable activation semantics require explicit review before execution.

PA-41-04 Idempotent commands [A]
Persist stable operation references and actual remote IDs; uncertain create responses are reconciled before another request can duplicate spend-capable entities.

PA-41-05 Partial-failure handling [A]
Retain per-object successes and errors with an accountable cleanup plan; one failed ad must not cause already created campaigns or budgets to be created again.

PA-41-06 Plan-to-remote comparison [A]
Compare intended and actual resulting configurations before activation; provider defaults or automatic recommendations cannot silently alter the approved scope.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S08. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

42. Pre-launch validation and activation approvals

PA-42-01 Launch checklist [A]
Check actual account readiness, budgets, dates, rights, facts, targeting, destinations, measurement and provider eligibility for the exact version proposed to launch.

PA-42-02 Concrete release preview [U]
Present the advertiser identity, spending authority, campaign settings and actual creative for approval; generic consent to research or draft is insufficient to start delivery.

PA-42-03 Approval snapshots [A]
Bind release permission to exact objects, settings, assets, account, period and budget envelope; material changes invalidate affected approval requirements.

PA-42-04 Independent financial checks [U]
Apply appropriate review for new spending commitments and budget increases; creative approval alone cannot establish permission to spend additional money.

PA-42-05 Controlled activation [A]
Execute only currently authorized state changes and retain provider responses; active configuration, approved ads, eligible inventory and actual delivery remain separate states.

PA-42-06 Post-launch verification [A]
Verify resulting objects, available review states, early delivery and spend evidence; unresolved uncertainty remains visible rather than being summarized as a completed successful launch.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

43. Live edits, replacements and configuration conflicts

PA-43-01 Editable-field matrix [X]
Verify field-specific update, replacement and immutable-object behavior by platform and campaign type; native editing does not imply an equivalent API mutation.

PA-43-02 Remote-state comparison [A]
Read current configurations where supported before applying changes; detect newer human, agency or provider changes and avoid silent overwrite.

PA-43-03 Impact assessment [U]
Review effects on review status, identity, links, learning, budget exposure and historical reporting before approving a material live change.

PA-43-04 Scoped mutations [A]
Apply only the approved changed fields with correct units and masks; an edit to one creative must not reset unrelated targeting or billing settings.

PA-43-05 Replacement workflows [U]
Approve explicit creation and retirement when a field is immutable; avoid overlap that unintentionally runs both old and new spend-capable ads.

PA-43-06 Correction verification [A]
Confirm actual remote state and retained history after editing; restoring a prior configuration cannot reverse impressions, spend or conversions that already occurred.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

44. Schedules, rules and automation conflict control

PA-44-01 Rule definitions [U]
Configure authorized triggers, evidence requirements, actions, spending scope and expiry; natural-language goals do not grant blanket authority to change live campaigns.

PA-44-02 Execution windows [A]
Resolve actual account time zones, business calendars and schedule inheritance; prevent daylight-saving shifts from creating unintended extra delivery or missed pauses.

PA-44-03 Rule ownership [A]
Inventory Lulu rules, native platform rules and other agencies or tools that can change the same objects; designate authority and detect conflicting interventions.

PA-44-04 Priority and locks [A]
Serialize or resolve incompatible mutations with bounded locks and explicit precedence; duplicate workers must not alternately enable and pause the same campaign.

PA-44-05 Cooldown and limits [U]
Apply approved change-frequency, cumulative budget-increase and intervention limits; prevent many small changes from bypassing a larger authority ceiling.

PA-44-06 Rule audit [A]
Record inputs, decision, rule version, approved authority and actual outcome for every execution; disabled or expired rules cannot continue through stale queued jobs.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

45. AI agents and bounded automatic optimization

PA-45-01 Autonomy modes [U]
Offer analysis-only, recommendation, approval-based execution and bounded automatic operation with explicit account, campaign, action and spending permissions. The selected mode remains visible on every proposed action.

PA-45-02 Evidence-grounded proposals [A]
Explain the actual data, uncertainty, constraints and expected mechanism behind suggested bid, budget, audience or creative changes; do not fabricate hidden platform insights.

PA-45-03 Execution-time checks [A]
Revalidate current authority, freshness, conversion quality and aggregate exposure before every mutation; stale evidence or revoked access blocks automatic expansion.

PA-45-04 Conservative control [U]
Define approved automatic reductions, pauses and bounded increases separately; each action must match actual capability and the advertiser's chosen risk tolerance.

PA-45-05 Agent isolation [A]
Treat external pages, ads, lead forms and reports as untrusted data; they cannot alter system permissions, reveal secrets or instruct unauthorized financial actions.

PA-45-06 Evaluation and suspension [U]
Review representative decisions and actual outcomes, suspend unsafe behavior and preserve accountable recovery; agent confidence scores are not proof of correctness or profit.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

46. Experiments, tests and learning discipline

PA-46-01 Experiment hypotheses [U]
Define the intended question, success measure, budget, sample context, duration and decision rule before launching a comparison that can spend money.

PA-46-02 Test eligibility [X]
Use actual supported experiments, split tests or holdouts where available; platform or campaign constraints may require dedicated budgets or manual setup.

PA-46-03 Randomization clarity [U]
Distinguish genuine randomized designs from sequential or observational comparisons; differing audiences, seasons and auction conditions can confound apparent creative winners.

PA-46-04 Test integrity [A]
Detect overlapping interventions, changed goals, premature stopping and incomplete outcome windows; flag compromised interpretation rather than claiming a conclusive result.

PA-46-05 Winner decisions [U]
Review effect size, uncertainty, business relevance and cost before scaling; avoid automatically favoring a noisy early result or a metric disconnected from real outcomes.

PA-46-06 Experiment closure [A]
Record actual results, approved rollout, retired variants and remaining obligations; test completion must not leave unintended extra campaigns spending indefinitely.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S18. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

47. Traffic quality, fraud signals and inventory review

PA-47-01 Quality signals [A]
Analyze available invalid-traffic adjustments, unusual clicks, geography and conversion patterns with source definitions; suspicious patterns are investigation signals rather than proven fraud.

PA-47-02 Placement review [U]
Assess actual available publisher, app and placement reports against approved suitability rules; incomplete reporting must not be represented as exhaustive inventory visibility.

PA-47-03 Lead-spam patterns [A]
Identify repeated submissions, implausible data and low-quality patterns using authorized evidence; protect legitimate customers and avoid unsupported accusations about individuals.

PA-47-04 Protective actions [U]
Apply approved exclusions, measurement fixes or pause decisions after sufficient review; available controls may reduce exposure without guaranteeing elimination of invalid traffic.

PA-47-05 Dispute preparation [U]
Prepare evidence for permitted platform billing or quality disputes with accountable approval; submitting a dispute does not establish eligibility for reimbursement.

PA-47-06 Quality reconciliation [A]
Reflect actual credits, invalid-event removals and late quality decisions in reports; preserve the difference between suspected waste and confirmed financial adjustments.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

48. Lead generation, calls and sales-quality feedback

PA-48-01 Lead assets [U]
Create supported forms, questions and disclosures using approved business purpose and relevant permissions; collect only the fields needed for the authorized workflow.

PA-48-02 Lead retrieval [X]
Retrieve permitted lead records with actual account access, expiry and synchronization behavior; a reporting count does not prove every individual record can be downloaded.

PA-48-03 Routing and acknowledgment [A]
Send authorized leads to the correct CRM or responsible team with stable IDs and duplicate checks; successful delivery must be distinguished from actual sales follow-up.

PA-48-04 Calls and messages [F]
Handle call details, recordings and message content only with appropriate permission and local review; an ad-management connection does not authorize unrestricted communications monitoring.

PA-48-05 Quality and response measures [A]
Track genuine duplicate, qualified, booked, won and rejected outcomes from authoritative sources; response-time or quality estimates must expose missing evidence.

PA-48-06 Feedback synchronization [X]
Submit supported qualified or won-event feedback with consent and actual acceptance diagnostics; do not claim that feedback automatically guarantees better future lead quality.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

49. Reporting, dashboards and accountable performance review

PA-49-01 Normalized reporting [A]
Display source-defined impressions, clicks, spend, conversions and values with currency, time-zone and attribution context; retain original provider metrics for drilldown.

PA-49-02 Metric definitions [U]
Define CPA, CPC, CPM, ROAS, qualified-lead cost and other measures with appropriate denominators; zero, missing, modeled and not-yet-mature data remain distinct.

PA-49-03 Client dashboards [U]
Provide scoped views of plans, actual changes, spend, results and open issues; show proposed recommendations separately from executed actions and observed outcomes.

PA-49-04 Historical revisions [A]
Refresh reports for conversion lag, credits and data corrections while preserving version context; changing historical figures must remain explainable.

PA-49-05 Performance narratives [A]
Summarize verified observations, decisions and uncertainties without claiming causal proof unsupported by the available evidence; generated explanations require attributable source metrics.

PA-49-06 Export and reconciliation [U]
Export usable records and definitions for business and finance review; reports must not expose another client's leads, credentials or account data.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

50. Anomalies, alerts and intervention verification

PA-50-01 Anomaly detection [A]
Detect unusual spending, lost delivery, conversion outages and unexpected account changes using approved thresholds, freshness and comparison rules.

PA-50-02 Alert context [A]
Include affected objects, source times, observed facts, uncertainty and recommended next steps; avoid presenting an automated suspicion as a verified root cause.

PA-50-03 Escalation routing [U]
Assign accountable owners and urgency levels for spending, privacy, policy and destination incidents; alert receipt is not equivalent to resolution.

PA-50-04 Pause verification [A]
Track requested, accepted and observed remote pause states where available; report unresolved delivery or delayed spend rather than asserting instant financial shutdown.

PA-50-05 Alert deduplication [A]
Group repeated signals without suppressing materially worse exposure or newly affected accounts; preserve a traceable incident record through the whole investigation.

PA-50-06 Resumption checks [U]
Require appropriate evidence, authority and risk review before restarting paused campaigns; disappearance of an alert alone does not establish that the cause was fixed.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

51. Ad policies, disapprovals and account restrictions

PA-51-01 Policy readiness [F]
Review advertiser identity, content, targeting and destination against applicable platform and local requirements; technical acceptance cannot substitute for qualified review where needed.

PA-51-02 Review-state ingestion [X]
Capture genuine submitted, under-review, limited, rejected and approved states with available explanations; saved objects are not automatically eligible for delivery.

PA-51-03 Correction workflows [U]
Prepare factual corrections and compliant alternatives tied to the stated problem; do not disguise the same prohibited offer or evade review by changing identities.

PA-51-04 Appeal handling [U]
Prepare supported appeals with truthful evidence and accountable approval; appeals, refunds and reinstatement remain external decisions without guaranteed outcomes.

PA-51-05 Account restrictions [A]
Pause affected automation after verified suspension, billing restriction or revoked permission; retain history and avoid creating replacement accounts to bypass enforcement.

PA-51-06 Policy-change response [F]
Identify affected campaigns after material rule changes and assign reviewed action; preserve actual effective dates and unresolved questions rather than silently claiming universal compliance.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

52. Billing, invoices, credits and financial handoff

PA-52-01 **Cost categories** [U]
Separate media delivery, platform fees, agency fees, generation costs, taxes and currency effects in plans and reports with responsible sources.

PA-52-02 **Billing evidence** [X]
Retrieve available invoices, billing summaries or credits only where supported and authorized; reporting access does not automatically permit payment-method or billing-profile changes.

PA-52-03 **Reported versus billed** [A]
Reconcile available served cost, reported spend, billed charges and adjustments using actual definitions; live estimates must not be represented as final settled invoices.

PA-52-04 **Tax review handoff** [F]
Provide actual seller, payer, jurisdiction and invoice facts to qualified finance owners; this bundle does not infer universal tax treatment from an account country setting.

PA-52-05 **Dispute and credit states** [U]
Track requested, accepted, rejected and received credits or reimbursements with genuine evidence; a pending dispute must not reduce actual spend as though refunded.

PA-52-06 **Finance exports** [A]
Send approved costs and document references to the Finance bundle with duplicate-safe records; ad management does not independently authorize bank transfers or accounting judgments.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S04. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

53. Agencies, client portfolios and delegated authority

PA-53-01 Client segregation [A]
Isolate accounts, audiences, creatives, lead records, budgets and reports across tenants and clients; shared agency access must not merge data or permissions.

PA-53-02 Delegation records [U]
Store actual client authority for each account, action and spending envelope with dates and revocation; a generic agency agreement may not cover every proposed live action.

PA-53-03 Portfolio views [U]
Compare actual enabled accounts and open risks using consistent definitions; preserve account currencies and avoid misleading aggregate return metrics.

PA-53-04 Cross-client templates [U]
Reuse permitted structure and non-confidential playbooks while removing client facts, audiences and protected assets; do not copy a successful client's private data into another account.

PA-53-05 Agency service accounting [A]
Track attributable management work, automation use and fees separately from media spend with transparent agreement references; internal charges cannot silently consume ad budget.

PA-53-06 Client handover [U]
Reconcile ownership, access, pending changes, active spend and reports before exit; disconnecting Lulu must not imply that campaigns stop running on the platform.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

54. APIs, events and connections to other Lulu bundles

PA-54-01 External action API [U]
Expose scoped plans, campaigns, approvals, budgets, jobs and outcomes with tenant authorization and typed validation; callers cannot bypass financial or specialist gates.

PA-54-02 Event contracts [A]
Emit versioned budget, approval, launch, edit, pause, conversion and incident events with stable references; receivers handle duplicates and out-of-order delivery safely.

PA-54-03 Content connection [U]
Request and receive approved advertising assets with paid-use rights, exact versions and disclosure context from the Content Creation bundle.

PA-54-04 Online Presence connection [U]
Exchange landing-page readiness, offer facts, merchant identities and conversion implementation tasks with site owners; ad permissions do not grant unrestricted website control.

PA-54-05 CRM and commerce connection [X]
Read authorized lead, sales, refund, stock and value evidence with freshness and purpose limits; protect personal data and preserve authoritative source identities.

PA-54-06 Finance and operations connection [U]
Share approved actual costs and capacity constraints with responsible systems; campaign optimization cannot independently alter payroll, banking, fulfillment or accounting records.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

55. Security, audit, identities and controlled access

PA-55-01 Role boundaries [U]
Separate analysts, creative editors, approvers, budget owners and administrators with account-specific action limits; enforce the same policy through APIs and AI tools.

PA-55-02 Sensitive data protection [A]
Protect customer identifiers, audiences, leads, tokens and billing documents with scoped access and appropriate logging controls; debug output cannot expose reusable secrets.

PA-55-03 Action audit [A]
Record initiator, rule or agent, approver, exact requested mutation and actual provider outcome with timestamps; preserve attributable history through corrections and exports.

PA-55-04 Malicious-input defense [A]
Treat external creatives, reports, pages and attachments as untrusted content; they cannot issue privileged instructions or redirect campaign credentials to another destination.

PA-55-05 Security response [U]
Contain compromised access or suspicious budget changes, preserve evidence and notify responsible owners through approved workflows; verify remote consequences before claiming resolution.

PA-55-06 Retention and evidence [F]
Apply reviewed retention, deletion and legal-hold rules with source and purpose context; necessary audit records and external platform copies require distinct handling decisions.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

56. Queues, partial failures and recovery

PA-56-01 Durable jobs [A]
Persist exact approved requests, remote references and intermediate outcomes so restarts do not lose pending work or duplicate spend-capable objects.

PA-56-02 Retry classification [A]
Distinguish temporary failure, invalid configuration, denied permission and uncertain acceptance; retries must not repeatedly submit an uncorrected rejected or unauthorized action.

PA-56-03 State reconciliation [A]
Compare local intentions with actual remote configurations after outages or delayed responses; unresolved conflicts remain assigned and visible before automatic processing resumes.

PA-56-04 Partial rollback [U]
Use approved compensating actions for already created objects where supported; rollback cannot undo delivered impressions or charges that have already accrued.

PA-56-05 Backup and restore [A]
Back up plans, approvals, identifiers, rules and integration mappings; restoration exercises verify relationships and reconcile active remote spend before re-enabling automation.

PA-56-06 Degraded operation [U]
Provide read-only, manual review or provider-native fallback with explicit authority and status; a manual instruction pack is not evidence of completed remote action.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S08. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

57. Worldwide markets, currencies and regulated categories

PA-57-01 Market readiness register [F]
Maintain reviewed advertiser, product, audience and country combinations with accountable owners, evidence and expiry; global architecture is not universal legal or platform authorization.

PA-57-02 Language and cultural review [U]
Apply local terminology, scripts, offers and disclosures with appropriate review; translated ad copy does not establish that the offer can be advertised or delivered locally.

PA-57-03 Currency integrity [A]
Keep native-currency budgets, micro-unit representations, displayed amounts and approved exchange-rate conversions explicit; a currency label error must never multiply actual spending authority.

PA-57-04 Calendar and jurisdiction [A]
Use actual account time zones, local dates, holidays and effective policy periods; period boundaries must remain consistent between budget authority and provider reporting.

PA-57-05 Restricted categories [F]
Review sensitive or restricted sectors, including applicable age, license, targeting and promotion requirements; do not invent a bypass for unavailable lawful advertising paths.

PA-57-06 Change-triggered review [A]
Reassess affected campaigns after legal, business, platform or eligibility changes; preserve unsupported or unresolved scope instead of presenting stale readiness as current approval.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

Research anchors: S20. Current effective rules and real account behavior require verification; references do not certify an implemented connector or legal suitability.

FUNCTION CATALOG / GLOBAL DESIGN

58. Emergency controls and business-continuity scenarios

PA-58-01 Emergency stop [A]
Stop new Lulu mutations and request supported remote pauses for the affected scope; distinguish local shutdown, accepted pause and actually observed campaign state.

PA-58-02 Broken measurement response [U]
Apply approved conservative policies when conversion signals fail, duplicate or become untrustworthy; do not let apparently perfect fabricated performance drive automatic scaling.

PA-58-03 Landing or stock crisis [A]
Trigger authorized intervention for verified broken destinations, recalled products or unavailable offers; preserve original evidence and any residual delivery exposure.

PA-58-04 Unauthorized spend response [U]
Contain suspicious changes, identify responsible access paths and reconcile actual exposure with account owners; do not promise immediate cancellation of already incurred charges.

PA-58-05 Recovery authority [U]
Require current permission, corrected prerequisites and appropriate financial review before resuming affected delivery; reverting local settings alone may not restore remote readiness.

PA-58-06 Continuity exercises [U]
Rehearse token revocation, provider outage, duplicate creation, budget conflicts and reporting delay with actual acceptance evidence; record failed and untested capabilities before release.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

59. Migration, rollout, training and customer exit

PA-59-01 Opening inventory [U]
Import existing accounts, campaign structures, assets, budgets and active rules with stable provider identities; a new integration must not recreate existing live campaigns.

PA-59-02 Read-only baseline [U]
Establish actual access, spend, measurement and configuration evidence before enabling writes; identify native rules and other tools that could conflict with Lulu changes.

PA-59-03 Progressive rollout [U]
Enable representative bounded operations in approved accounts with monitored outcomes and rollback decisions; successful sandbox requests do not establish production entitlement.

PA-59-04 User training [U]
Explain budgets, authority, attribution limits, approval snapshots and actual stop behavior with practical examples; verify responsible users can handle representative errors.

PA-59-05 Exit reconciliation [U]
Resolve queued actions, active remote campaigns, delegated access and ongoing billing responsibilities before disconnection; document what will continue to spend after Lulu access ends.

PA-59-06 Usable handover [U]
Export permitted plans, IDs, assets, rules, approvals, definitions and open issues; preserve ownership and revoke only the intended credentials after authorized transfer.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

FUNCTION CATALOG / GLOBAL DESIGN

60. Coverage review and continuous improvement

PA-60-01 Requirement ownership [U]
Assign every capability an owner, actual dependencies, action authority and verification status; a function listed here is not an implemented or certified feature.

PA-60-02 Scenario coverage [U]
Review acquisition, commerce, local leads, creative changes, consent, offline sales and client exit across each actual intended provider and market.

PA-60-03 Source freshness [X]
Check current official API and policy documentation plus real account behavior before rollout and after relevant changes; future announcements do not establish present capability.

PA-60-04 Acceptance evidence [U]
Require representative launch, edit, pause, spending, measurement, security and recovery results with clear failed, blocked and untested outcomes.

PA-60-05 Outcome learning [U]
Review actual business results and operational incidents without rewriting history or treating platform recommendations as guaranteed improvement; retain uncertainty and unintended consequences.

PA-60-06 Gap expansion [A]
Convert uncovered needs and incidents into versioned requirements, owners and tests; repeat the review without claiming permanent universal 100-percent completeness.

Release gate: validate facts, rights, account authority, approved financial scope and actual provider capability; bind the correct version, exercise the failure path and retain genuine outcome evidence. All entries are proposed requirements.

07 / CROSS-MODULE COVERAGE

End-to-end workflows - 1 of 3

New advertiser to controlled launch

Verify business and account -> establish actual goals and measurement -> approve offer, creative and spending envelope -> validate destination and rights -> build supported inactive objects -> compare remote settings -> approve activation -> verify actual delivery and exposure.

Control: No live spending before current financial and release authority exists. **Modules:** 01-08, 16-27, 41-42.

Paid search optimization

Approved Search structure -> actual query and cost data -> mature conversion or qualified-outcome evidence -> relevant keyword and negative proposals -> conflict and authority checks -> approved mutation -> remote verification -> outcome review.

Control: Unseen queries and immature conversion periods cannot be treated as definitive evidence of waste or profit. **Modules:** 10-12, 23-29, 43-46, 49.

Shop products to paid product campaign

Verify catalog and merchant readiness -> reconcile real products, stock, price and rights -> approve supported campaign and budget -> launch eligible products -> monitor diagnostics -> review actual sales and refunds -> adjust within authority.

Control: A feed being accepted does not establish eligibility, delivery or net margin. **Modules:** 13-14, 18-23, 25-30, 39.

Local lead campaign

Verify genuine business, service categories and market eligibility -> determine actual program and API support -> authorize settings and spend -> collect permitted lead evidence -> route to responsible sales team -> record genuine quality and outcomes.

Control: Do not infer worldwide LSA creation support, verification success or refundable leads from a generic connector. **Modules:** 04, 05, 15, 26, 33, 48, 51.

07 / CROSS-MODULE COVERAGE

End-to-end workflows - 2 of 3

Paid social creative refresh

Approved offer and audience -> paid-use assets and identity permissions -> platform-specific format validation -> creative and budget authority -> controlled release -> review and delivery evidence -> sufficiently mature comparison -> authorized refresh.

Control: A content-generation approval does not grant promotion rights or permission to increase media spend. **Modules:** 13-20, 34-38, 41-46.

Budget threshold and delayed data

Read source-dated spend -> assess active settings and unresolved exposure -> apply approved guard band -> request authorized reduction or pause -> verify remote state -> monitor late evidence -> reconcile actual billed amounts.

Control: Local thresholds and accepted pause requests cannot guarantee an exact instantaneous final spend amount. **Modules:** 08-09, 44-45, 50, 52, 58.

CRM sale and later refund

Record genuine lead and sale identities -> validate permitted event data -> deduplicate browser, server and offline signals -> submit eligible outcomes -> retain acceptance diagnostics -> receive actual refund -> perform supported adjustment -> reconcile reports.

Control: Do not double count the same order or assume submitted adjustments immediately changed every platform report. **Modules:** 23-28, 48-49, 52, 54.

Experiment to authorized rollout

Approve hypothesis, test design and budget -> verify experiment eligibility -> launch controlled arms -> prevent conflicting edits -> wait for appropriate outcome maturity -> review uncertainty -> approve rollout or closure -> verify remaining active objects.

Control: A noisy apparent winner does not automatically authorize larger spending or indefinite extra test campaigns. **Modules:** 05-11, 41-46, 49.

07 / CROSS-MODULE COVERAGE

End-to-end workflows - 3 of 3

Uncertain API result or conflicting agency change

Persist request and approved version -> identify timeout or newer remote state -> query actual objects -> reconcile partial success -> resolve conflicting authority -> retry only eligible unresolved work -> verify aggregate exposure.

Control: Never recreate an accepted spend-capable campaign just because the local request timed out. **Modules:** 02-03, 08, 41-45, 53, 56.

Client exit and ongoing remote delivery

Inventory live campaigns, pending jobs and native rules -> agree stop or transfer responsibilities -> reconcile spending and access -> execute authorized remote changes -> export evidence -> revoke intended credentials -> retain unresolved obligations.

Control: Disconnecting Lulu does not itself stop campaigns already running at the provider. **Modules:** 09, 44, 52-56, 59.

08 / PROPOSED VERIFICATION

Acceptance scenarios - 1 of 5

Proposed tests, not proof that a system has passed them. Use representative advertiser accounts, source evidence and actual remote-state checks with expressly bounded authority. Record failed, blocked and untested results.

QA-001 | Wrong advertiser identity
A request targeting a different client, manager path or business identity is blocked even when the token can access that account.

QA-002 | Revoked permissions
Queued writes fail safely after access revocation and cannot switch credentials or accounts without current authority.

QA-003 | UI-only capability
A native interface feature unavailable through the actual API remains blocked or becomes an explicit manual task.

QA-004 | Unverified advertiser
A submitted verification application is not treated as approval or automatic permission for live delivery.

QA-005 | Incorrect goal mapping
A page view or button click cannot silently become the primary purchased or qualified-lead outcome.

QA-006 | Fabricated research
Unknown competitor spend and results remain unknown and are not inserted as verified campaign-planning evidence.

QA-007 | Unapproved allocation
Moving money to another platform requires the relevant current allocation authority and cannot bypass the overall envelope.

QA-008 | Average-daily semantics
The interface distinguishes a daily average from provider-specific billed limits and never labels it a universal exact hard cap.

QA-009 | Stale cost report
Automatic expansion stops or follows the approved conservative policy when spending evidence is too old or incomplete.

QA-010 | Currency or micro-unit error
A mismatched currency or scale fails validation before a request can multiply the intended budget or bid.

QA-011 | Parallel budget increases
Two individually valid jobs cannot jointly exceed delegated authority or a shared-budget envelope.

QA-012 | Budget change mid-period
Exposure and applicable provider-limit calculations are reevaluated after the budget changes rather than reusing a stale monthly estimate.

08 / PROPOSED VERIFICATION

Acceptance scenarios - 2 of 5

Proposed tests, not proof that a system has passed them. Use representative advertiser accounts, source evidence and actual remote-state checks with expressly bounded authority. Record failed, blocked and untested results.

QA-013 | Unsupported bid strategy
An invalid objective, goal or campaign combination is reported and cannot be silently changed to another strategy.

QA-014 | Immature conversion window
Recent missing conversions are labeled incomplete and cannot automatically prove that an otherwise valid campaign has no business value.

QA-015 | Negative-keyword conflict
A proposed exclusion that blocks approved valuable searches is flagged for review before activation.

QA-016 | Customer-list permission
Data without the required permission or accepted platform terms cannot be uploaded merely because it is hashed.

QA-017 | Audience withdrawal
Affected future processing stops appropriately and unresolved downstream audience updates remain visible.

QA-018 | Targeting semantics
A platform signal or expanded audience is not displayed as a strict restriction when the actual control does not enforce it.

QA-019 | Unsupported location
A region outside actual advertiser service coverage cannot be enabled solely because the platform accepts it.

QA-020 | Expired offer
Scheduled activation is blocked when its price, availability or conditions no longer match approved business facts.

QA-021 | Responsive-copy combinations
Potentially misleading combinations of independently valid text assets are detected or assigned review before release.

QA-022 | Paid-use rights gap
An image licensed only for another context cannot proceed to advertising without reviewed permission for the intended paid use.

QA-023 | Creator authorization expiry
Expired promotion rights or missing creator authorization blocks the dependent release and identifies affected live use.

QA-024 | Rejected media processing
An uploaded asset still processing or rejected by the provider cannot be reported as an eligible live ad.

08 / PROPOSED VERIFICATION

Acceptance scenarios - 3 of 5

Proposed tests, not proof that a system has passed them. Use representative advertiser accounts, source evidence and actual remote-state checks with expressly bounded authority. Record failed, blocked and untested results.

QA-025 | Broken landing page
Verified destination failures trigger the approved intervention and preserve actual pause evidence and residual-exposure uncertainty.

QA-026 | Product feed mismatch
A stale price, currency or stock state creates corrective work instead of silently advertising an unavailable or inaccurate offer.

QA-027 | Browser event duplication
Reloading the confirmation page cannot create several confirmed purchases for the same actual order.

QA-028 | Browser-server deduplication
The same transaction sent through two approved collection paths is reconciled using the supported identity design.

QA-029 | Consent-state handling
Relevant denied or withdrawn choices follow the approved collection behavior and cannot be bypassed by moving the same data server-side.

QA-030 | Test traffic isolation
Development and test events cannot inflate production outcomes or drive live bidding as real verified sales.

QA-031 | Offline export replay
Replaying a CRM export does not upload the same qualified lead or sale as another new conversion.

QA-032 | Refund adjustment
Submitted retractions or revised values remain distinct from confirmed platform processing and reconciled reporting.

QA-033 | Cross-channel duplication
One transaction attributed by several platforms remains one business transaction in deduplicated outcome reporting.

QA-034 | Missing modeled data
Unknown or modeled metrics are not converted into invented observed users or precise causal profit claims.

QA-035 | Merchant eligibility gap
Accepted catalog data does not cause the system to declare merchant approval or actual product-ad delivery.

QA-036 | Google video mutation limit
An unsupported video-related write remains blocked even when reporting for the same campaign works.

08 / PROPOSED VERIFICATION

Acceptance scenarios - 4 of 5

Proposed tests, not proof that a system has passed them. Use representative advertiser accounts, source evidence and actual remote-state checks with expressly bounded authority. Record failed, blocked and untested results.

QA-037 | LSA variant and country
Creation and editing capability are validated for the actual Local Services variant, country and API version rather than assumed globally.

QA-038 | Organic versus paid access
Permission to publish organic content is not reused as proof of advertising or existing-post promotion authority.

QA-039 | Platform format mismatch
Unsupported objective, placement or creative combinations fail explicitly rather than being replaced with materially different approved-looking settings.

QA-040 | Conditional regional adapter
An untested app-store, regional or premium-network operation remains unavailable until actual access and representative tests are verified.

QA-041 | Inactive campaign construction
Draft preparation does not accidentally start spending through provider defaults or an automatically active child object.

QA-042 | Timeout after creation
The system looks for the genuine accepted campaign before retrying an uncertain create request.

QA-043 | Partial batch failure
Already created parents and successful ads retain their identities while only eligible unresolved work is retried or corrected.

QA-044 | Approval snapshot changed
Changing the creative, destination, account, targeting or financial scope invalidates the affected release approval.

QA-045 | Unsupported in-place edit
An immutable change requires an approved replacement path and cannot be falsely reported as a successful field edit.

QA-046 | Duplicate replacement overlap
A replacement workflow identifies whether both old and new entities could spend and prevents unapproved concurrent delivery.

QA-047 | Native-rule conflict
A platform rule or another agency tool trying to undo a Lulu pause creates an accountable conflict instead of an endless toggle loop.

QA-048 | Cumulative small increases
Repeated small automatic increases remain subject to the cumulative delegated authority and approved period.

08 / PROPOSED VERIFICATION

Acceptance scenarios - 5 of 5

Proposed tests, not proof that a system has passed them. Use representative advertiser accounts, source evidence and actual remote-state checks with expressly bounded authority. Record failed, blocked and untested results.

QA-049 | Malicious external instruction
An imported ad, webpage or lead payload cannot redirect tokens, expand financial authority or execute unauthorized tools.

QA-050 | Experiment contamination
Unexpected concurrent changes are recorded and limit conclusions instead of producing an unjustified definitive winner.

QA-051 | Experiment closure
Ending a test reconciles treatment delivery so unintended extra campaigns do not keep spending unnoticed.

QA-052 | Suspected invalid traffic
A suspicious pattern remains an investigation signal; reimbursement is not shown as received before genuine provider evidence exists.

QA-053 | Lead-routing duplication
Repeated retrieval cannot create duplicate CRM leads, and successful handoff is not confused with actual sales follow-up.

QA-054 | Accepted pause versus spend
A pause response and delayed spending report remain distinct; the interface does not promise instant zero residual exposure.

QA-055 | Disapproval appeal
An appeal submission remains pending and cannot be reported as reinstatement or permission to evade the restriction.

QA-056 | Served versus billed costs
Late credits, taxes and billing adjustments reconcile without rewriting live estimates as though they were final invoices.

QA-057 | Cross-client data isolation
Audience, lead, creative, budget and billing data cannot leak through portfolio reports, exports or guessed identifiers.

QA-058 | Restore with remote spend
Restoring local records triggers remote reconciliation before rules resume and does not recreate campaigns already running.

QA-059 | Emergency restart
A vanished alert cannot restart delivery without the required corrected evidence, financial scope and current authority.

QA-060 | Disconnect while campaigns run
Client exit explicitly records remote delivery and payer responsibilities; removing a token alone is not labeled as campaign shutdown.

09 / SCOPE REVIEW

Completeness audit and gap-expansion record

Review area	Modules	Functions
Advertisers, readiness, goals and media planning	01-07	42
Budgets, exposure, bidding and estimates	08-11	24
Keywords, audiences, delivery and creative strategy	12-16	30
Creative assets, destinations and catalogs	17-22	36
Conversions, consent, attribution and data quality	23-28	36
Provider-specific campaign and network workflows	29-40	72
Construction, approvals, live edits, rules and tests	41-46	36
Quality, leads, reporting, incidents and billing	47-52	36
Agency, integrations, security, recovery and governance	53-60	48

What the gap review explicitly challenged

Daily-average versus actual provider limits; shared budgets and simultaneous changes; delayed cost reports and pause propagation; currency scale; source permissions; browser-server duplicates; immature conversions; cross-platform double counting; unsupported video writes; LSA campaign variants; creator promotion rights; immutable creative fields; native-rule conflicts; partial remote success; experiment leftovers; final invoices; and campaigns still spending after client disconnection.

Declared baseline

360 numbered functions in 60 modules, ten cross-module workflows and 60 proposed acceptance scenarios. Module counts, identifiers, page references, text and rendered layout are checked. Provider documentation anchors selected boundaries; real account testing is still required.

This catalog is a reviewed requirements baseline, not an implemented-product audit, complete worldwide legal survey, certified spend controller or promise of profitable advertising. New platforms, goods, markets and incidents are explicit triggers for another gap review.

10 / DELIVERY BLUEPRINT

Implementation packages and repeatable scope review

Package	Practical release scope	Evidence before activation
Read-only foundation	Accounts, access, definitions, imports, reports, spend freshness and current active rules.	Correct ownership, source accuracy, tenant isolation and usable reconciliation.
Planning and creation	Media plans, creative, targeting, measurement and non-spending campaign drafts.	Actual supported operations, rights, readiness and exact configurations.
Controlled launch	Bounded activation, spending authority, edit workflows and verified pause behavior.	Explicit approvals, aggregate exposure checks, real remote-state and failure-path tests.
Outcome feedback	Permitted conversion events, CRM quality, refunds, mature reports and experiments.	Consent, identity, duplicate prevention, processing diagnostics and interpretation limits.
Bounded optimization	Authorized rules or agents with pacing, cooldowns, conflict control and recovery.	Representative decisions, freshness limits, cumulative authority and emergency exercises.

Repeat the completeness review

1. Declare the actual advertiser, accounts, products, markets and intended operations. 2. Walk planning, creative, launch, delivery, outcome measurement, billing and exit. 3. Map authority, source truth, provider capability and dependencies at every step. 4. Challenge missing, stale, duplicate, conflicting and unsafe inputs. 5. Add uncovered functions with owners. 6. Test representative execution and retain real results. 7. Publish supported scope and remaining limitations. 8. Recheck after material account, API, policy, model or business changes.

The customer can buy one coherent Lulu Paid Advertising bundle while specialized systems execute particular steps. Actual account entitlement, spending responsibility, data permissions and unsupported operations remain visible. A finite document cannot establish permanent universal 100-percent completeness.

11 / RESEARCH ANCHORS

Primary-source register - 1 of 4

Selected official sources reviewed on 29 October 2026. Feature descriptions are original proposed requirements. These anchors are not a complete worldwide legal survey, vendor recommendation, verified account entitlement or production test. Apply current effective versions and actual account behavior.

S01 | Google Ads API: campaigns overview
Campaign types and API-versus-interface boundaries. Verify actual supported operations and versions rather than equating UI objectives with universal API functionality.
https://developers.google.com/google-ads/api/docs/campaigns/overview

S02 | Google Ads API: campaign budgets
Budget types and shared-budget behavior have specific meanings. Match the real campaign, eligibility and period instead of exposing one misleading generic cap field.
https://developers.google.com/google-ads/api/docs/campaigns/budgets/create-budgets

S03 | Google Ads Help: spending limits
Explains average-daily, daily and monthly limits, exceptions and effects of changes. This is a Google-specific reference, not a universal cross-network budget formula.
https://support.google.com/google-ads/answer/10486637/about-spending-limits

S04 | Google Ads Help: overdelivery
Served and billed costs can differ; actual billing evidence and adjustments matter. Monitoring thresholds and provider charging rules are distinct controls.
https://support.google.com/google-ads/answer/1704443?hl=en

S05 | Google Ads API: conversion setup
Actual conversion configuration, data permissions and accepted consent settings require explicit implementation and verification.
https://developers.google.com/google-ads/api/docs/conversions/getting-started

11 / RESEARCH ANCHORS

Primary-source register - 2 of 4

Selected official sources reviewed on 29 October 2026. Feature descriptions are original proposed requirements. These anchors are not a complete worldwide legal survey, vendor recommendation, verified account entitlement or production test. Apply current effective versions and actual account behavior.

S06 | Google Ads API: online conversions
Tagging, permitted user-provided data, normalization and supported enhancement workflows require appropriate account and event eligibility.
https://developers.google.com/google-ads/api/docs/conversions/upload-online

S07 | Google Tag Platform: consent mode
Tag behavior follows communicated choices; obtaining valid permissions and selecting an appropriate implementation remain separate advertiser responsibilities.
https://developers.google.com/tag-platform/security/concepts/consent-mode

S08 | Google Ads API: partial failure
A request can have different per-operation outcomes where supported. Preserve successful objects and inspect errors rather than blindly replaying the whole job.
https://developers.google.com/google-ads/api/docs/best-practices/partial-failures

S09 | Google Ads API: video campaigns
Video-related write capability is restricted and version dependent; reporting support is not blanket permission to create or mutate every video campaign.
https://developers.google.com/google-ads/api/docs/video/overview?hl=en

S10 | Google Ads API: Local Services campaigns
Standalone and newer Local Services variants have different operations, country and version conditions. Recheck current account eligibility and exact campaign type.
https://developers.google.com/google-ads/api/docs/campaigns/local-service-campaigns

11 / RESEARCH ANCHORS

Primary-source register - 3 of 4

Selected official sources reviewed on 29 October 2026. Feature descriptions are original proposed requirements. These anchors are not a complete worldwide legal survey, vendor recommendation, verified account entitlement or production test. Apply current effective versions and actual account behavior.

S11 | Meta: official Marketing API workspace
Meta-published request collections anchor campaign, ad-set, creative and reporting workflows. Actual permissions, versions and product requirements still need verification.
https://www.postman.com/meta/facebook-marketing-api/overview

S12 | LinkedIn: Marketing Developer Platform
Advertising, account, campaign, creative, targeting, lead and reporting interfaces have their own requirements. Organic-page access does not establish paid-product entitlement.
https://learn.microsoft.com/de-de/linkedin/marketing/integrations/marketing-integrations-overview

S13 | TikTok: API for Business overview
Marketing and organic interfaces are distinct scopes. Verify actual advertiser access, ad products, creator authorization and supported mutation behavior.
https://ads.tiktok.com/resources/help/article/marketing-api?lang=en&redirected=2

S14 | Microsoft Advertising: Campaign Management API
Campaign services and operations provide provider-specific entity and setting definitions; imported settings need actual semantic validation.
https://learn.microsoft.com/en-us/advertising/campaign-management-service/campaign-management-service-reference

S15 | Pinterest: campaigns and ad groups
Budget modes, parent-child schedule behavior and mutable fields vary. Actual access and format eligibility require separate review.
https://developers.pinterest.com/docs/work-with-ads/create-campaigns-and-ad-groups/

11 / RESEARCH ANCHORS

Primary-source register - 4 of 4

Selected official sources reviewed on 29 October 2026. Feature descriptions are original proposed requirements. These anchors are not a complete worldwide legal survey, vendor recommendation, verified account entitlement or production test. Apply current effective versions and actual account behavior.

S16 | Snap: Ads API introduction
Paid structures, creative, targeting and reporting require appropriate organization and ad-account setup. Other profile interfaces can have different access requirements.
https://developers.snap.com/marketing-api/Ads-API/introduction

S17 | Amazon Ads: API access and scope
Programmatic advertising requires actual application approval and applicable product access. Retail selling access alone is not proof of API entitlement.
https://advertising.amazon.com/about-api

S18 | Google Ads API: experiments
Experiment workflows, controls, treatment and lifecycle differ. Test setup and reporting do not automatically justify causal or profitable-scaling claims.
https://developers.google.com/google-ads/api/docs/experiments/overview

S19 | Google Ads API: conversion management
Conversion categories, uploads, adjustments and actual processing require correct account and event mapping; preserve business outcomes separately from attributed reports.
https://developers.google.com/google-ads/api/docs/conversions/overview

S20 | IANA: time-zone database
Maintained civil-time rules support actual account periods and schedules. Implement current data and explicit handling of ambiguous or changed local times.
https://www.iana.org/time-zones
